worldsteel LCA eco-profile

HOT ROLLED COIL

Declared product  | 1 metric tonne of Hot rolled coil
System boundary  | Cradle-to-gate + end-of-life
Production routes | BOF and EAF
Geographic scope | Global average
Normative reference | worldsteel LCI methodology report, ISO 14040/44
LCIA methodology | Selected indicators according to EN 15804+A1:2013
Allocation of co-products | System expansion
Owner of the declaration | World Steel Association
Publication date | May 2022
Verification | Externally - worldsteel methodology
| Internally - applied data
| Internally - fact sheet

in cooperation with
Daxner & Merl GmbH
worldsteel LCA eco-profile

This LCA eco-profile refers to the life cycle assessment results of global hot rolled coil published by the World Steel Association. It aims at the transparent communication of life cycle related environmental indicators on a global basis. All presented impact assessment results build on the worldsteel 2021 LCI Study Report as well as the worldsteel Life Cycle Inventory Methodology Report 2017. Other LCI data may have different scopes, boundaries and implement different methodologies.

Declared product

The presented results refer to a declared unit of 1 metric tonne of hot rolled coil representing a global industry average.

Product description

Steel coil rolled on a hot-strip mill; can be further processed. Typical thickness between 2 - 7 mm. Typical width between 600 - 2100 mm

Applications in virtually all sectors of industry: transport, construction, shipbuilding, gas containers, pressure vessels, energy pipelines, etc.

Scope

The assessment covers the cradle-to-gate LCA results of the declared steel products including the end-of-life-recycling (see Figure 1).

The cradle-to-gate LCI study with end-of-life recycling includes net credits (the amount of end-of-life scrap minus any scrap consumed in the production of the product) associated with recycling the steel from the final products at the end-of-life (end-of-life scrap) with a 95% end-of-life recycling rate. This study does not include the manufacture of the downstream final products or their use.

The primary data collected from the steel companies relates to the production from 2016 to 2020 and is believed to be representative of global steel production during this time frame. 143 steel production sites from 37 companies have contributed to the 2021 worldsteel LCI data release. Allocation of environmental impacts between the steel product and resulting co-products follow the worldsteel methodology applying system expansion (see worldsteel 2021 LCI Study Report for further details).
The calculation is based on GaBi background data - GaBi software version 10.6.0.110, database version 2021.2. Therefore, allocation in the supply chain follows the assumptions of the GaBi-database. Further information of the applied background data is given in the worldsteel 2021 LCI Study Report.

End-of-life allocation follows the approach defined according to worldsteel's LCI methodology, whereby the net amount of scrap reaching the end-of-life stage is calculated. This is then reported separately to the cradle-to-gate impacts.

This evaluation complies with the requirements of ISO 14040 and ISO 14044. It represents a basis for potential B2B and B2C communication of the environmental impacts of the analysed steel products.

**Content of recycled steel**

The total amount of iron and steel scrap used to make the product is **0.154 metric tonnes scrap/tonne of steel product**.

In this case, the scrap input refers to the net scrap input, i.e., it does not consider the recirculating, internal or home scrap that is generated in the processes that are being studied, i.e., scrap from the hot rolled coil rolling process that goes back into the BOF or EAF is not included as an external scrap input for hot rolled coil. Thus, the scrap input is often considered to be external to the production of the product as well as post-consumer
scrap, i.e., scrap produced in processes downstream of the production of the steel product in question: on the steel plant, fabrication and manufacturing scrap as well as end-of-life scrap (see further information in the worldsteel methodology report, 2017).

LCA Results

The presented results refer to the life cycle related environmental footprint of 1 metric tonne of steel product. Table 1 presents the product’s potential environmental impact according to selected indicators following EN 15804+A1, given that this is a standard often used for construction products. In addition, selected life cycle inventory indicators are illustrated in Table 2. The chosen indicators refer to the selection applicable for sustainable building certification according to the DGNB system.
